

Northbank.

Product Manager — take-home task

Northbank is a fictional company created for this exercise. All data is synthetic — no real customers are represented.

The scenario

You're a Product Manager at **Northbank**, a personal finance app. We recently launched an **unsecured loan refinance** product: when we can see that a customer holds a personal loan with another lender, we offer to refinance it — a new Northbank loan that pays off (settles) their existing one, ideally saving them money.

You're preparing for a chat with our **Managing Director and Head of Product**. They want to hear your findings on how the refinance journey is performing, and your view of the roadmap for next quarter.

How the product works

- Each month, eligible customers receive a **refinance offer**. The offer screen shows the proposed new loan — monthly payment, term, and total amount payable — alongside the same figures for their current loan.
- An offer lives for one month, then times out. Customers who remain eligible get a fresh offer the following month.
- To let customers know they have an offer, we send **emails to most customers and push notifications to some of them**.
- If a customer taps **apply**, the journey is:
 1. **Standard requirements** — identity checks and income verification.
 2. **Settlement quote** — the customer obtains a settlement letter from their current lender (the document stating the exact amount required to close their loan) and uploads it to us.
 3. **Settlement verification** — we check the uploaded document and confirm the settlement figure.
 4. **Payout** — we pay off the old loan directly and the new Northbank loan goes live.

The data

You have three files, extracted on **31 August 2026**. The extract covers offers created **March–June 2026**, so that every application in it has reached a final outcome. Lender names are anonymised. Field definitions are in the accompanying data dictionary.

- `funnel.csv` — refinance applications and how far each one progressed
- `quotes.csv` — the offer we made and the customer's current loan

- `survey.csv` — responses to a customer survey conducted on **31 July 2026** among customers who hadn't taken up their refinance offer

The task

Question 1. Using the data available to you, report on how the funnel is working — which areas are doing well, and which could be improved.

Question 2. Summarise the major findings from the customer survey for the product team in **one slide or less**. (We expect this to take well under an hour — we're interested in what you choose to put on the slide.)

Question 3. Finally, create a list of 5–10 initiatives that you would prioritise for the refinance cross-sell product next quarter. Briefly justify the ordering of your prioritisation.

Practicalities

- This should take **no longer than a couple of evenings**.
- Use **any tools you like** — spreadsheets, SQL, Python, anything else.
- **AI tools are actively encouraged.** We work with them daily and expect you to as well. We'll chat about how you approached the task — including how you used AI — in the follow-up conversation.
- Deliver your answers in whatever format you think best communicates them (document, deck, notebook...), and include any working files alongside.
- **Submission:** please upload your answers and working files via the link sent to you by email, within **3–5 days** of receiving this pack.
